

Axio Hub - One-Page App Summary

What it is

Axio Hub is an AI-powered knowledge management platform with RAG capabilities. It delivers a Next.js web app backed by a FastAPI API for search and chat over ingested content.

Who it's for

Primary persona: privacy-conscious teams that need a unified, searchable knowledge base across many sources.

What it does

- Connects data sources: Google Drive, Dropbox, OneDrive/SharePoint, Box, Notion, GitHub, S3/SFTP, web crawl, and file uploads.
- Parses many formats (PDF, DOCX, code, Markdown, HTML, CSV, images, email).
- Generates embeddings and indexes chunks for hybrid search (pgvector + full-text + RRF).
- Provides scope-aware chat/conversations with guardrails for context disambiguation.
- Supports teams/orgs, usage/quotas, subscriptions/billing, and notifications.
- Includes Ghost Protocol zero-retention security and malware scanning.

How it works

- Frontend: Next.js 14 App Router (TypeScript, Tailwind) with Supabase Auth/Realtime.
- API: FastAPI service exposes uploads/search/chat/documents; uses Supabase client.
- Workers: Celery (Redis broker) queues parsing, embedding, and indexing tasks.
- Parsing: document processor factory handles PDF/DOCX/code/HTML/etc with OCR fallbacks.
- Storage & retrieval: Supabase Postgres with pgvector + full-text; hybrid search with RRF.
- Data flow: Sources/Uploads -> Connectors -> Parsing -> Embeddings -> Index -> Search/Chat.

How to run

1. Backend + Redis: docker-compose up --build (uses .env).
Backend required keys listed in backend/core/config.py.
2. Frontend: cd frontend-new
npm install
npm run dev
3. Frontend env: NEXT_PUBLIC_SUPABASE_URL, NEXT_PUBLIC_SUPABASE_ANON_KEY
(Google/Microsoft client IDs optional).
4. Open <http://localhost:3000>
